Photon Voice Doxygen Readme

Offline Docs

Manual Generation

To manually generate doxygen offline files:

```
"doxygen .\Docs\doxygen\voice-doxxygen-offline.config"
```

Automatic Generation

Simply run "Docs\generate_offline.bat". Open the file and edit DOXYGEN_PATH accordingly. Also you need a LaTeX distribution installed and some packages/dependencies.

This script will also copy the offline files to their respective locations and then clean up.

Files

HTML

It is not possible to disable HTML files generation. So those are just ignored or cleaned up after generation.

CHM

"PhotonVoice-Documentation.chm" should be copied

to "Assets\Photon\PhotonVoice-Documentation.chm"

from "Docs\TempOutputDocs\VOICE_OFFLINE_HTML\PhotonVoice-Documentation.chm".

PDF

"PhotonVoice-Documentation.pdf" should be copied

to "Assets\Photon\PhotonVoice-Documentation.pdf"

from "Docs\TempOutputDocs\latex\refman.pdf".

Online Docs

To manually generate doxygen online files:

```

Classes

Enumerations

- enum [AudioSessionCategory](#)

- enum [AudioSessionCategoryOption](#)

2.3.1 Enumeration Type Documentation

2.3.1.1 enum `AudioSessionCategory` [strong]

Enumerator

Ambient Use this category for background sounds such as rain, car engine noise, etc. Mixes with other music. `API_AVAILABLE(ios(3.0), watchos(2.0), tvos(9.0)) API_UNAVAILABLE(macos);`

SoloAmbient Use this category for background sounds. Other music will stop playing. `API_AVAILABLE(ios(3.0), watchos(2.0), tvos(9.0)) API_UNAVAILABLE(macos);`

Playback Use this category for music tracks. `API_AVAILABLE(ios(3.0), watchos(2.0), tvos(9.0)) API_UNAVAILABLE(macos);`

Record Use this category when recording audio. `API_AVAILABLE(ios(3.0), watchos(2.0), tvos(9.0)) API_UNAVAILABLE(macos);`

PlayAndRecord Use this category when recording and playing back audio. `API_AVAILABLE(ios(3.0), watchos(2.0), tvos(9.0)) API_UNAVAILABLE(macos);`

AudioProcessing Use this category when using a hardware codec or signal processor while not playing or recording audio. `API_DEPRECATED("No longer supported", ios(3.0, 10.0)) API_UNAVAILABLE(watchos, tvos) API_UNAVAILABLE(macos);`

MultiRoute Use this category to customize the usage of available audio accessories and built-in audio hardware. For example, this category provides an application with the ability to use an available USB output and headphone output simultaneously for separate, distinct streams of audio data. Use of this category by an application requires a more detailed knowledge of, and interaction with, the capabilities of the available audio routes. May be used for input, output, or both. Note that not all output types and output combinations are eligible for multi-route. Input is limited to the last-in input port. Eligible inputs consist of the following: `AVAudioSessionPortUSBAudio`, `AVAudioSessionPortHeadsetMic`, and `AVAudioSessionPortBuiltInMic`. Eligible outputs consist of the following: `AVAudioSessionPortUSBAudio`, `AVAudioSessionPortLineOut`, `AVAudioSessionPortHeadphones`, `AVAudioSessionPortHDMI`, and `AVAudioSessionPortBuiltInSpeaker`. Note that `AVAudioSessionPortBuiltInSpeaker` is only allowed to be used when there are no other eligible outputs connected. `API_AVAILABLE(ios(6.0), watchos(2.0), tvos(9.0)) API_UNAVAILABLE(macos);`

2.3.1.2 enum `AudioSessionCategoryOption` [strong]

Enumerator

MixWithOthers This allows an application to set whether or not other active audio apps will be interrupted or mixed with when your app's audio session goes active. The typical cases are: (1) `AVAudioSessionCategoryPlayAndRecord` or `AVAudioSessionCategoryMultiRoute` this will default to false, but can be set to true. This would allow other applications to play in the background while an app had both audio input and output enabled (2) `AVAudioSessionCategoryPlayback` this will default to false, but can be set to true. This would allow other applications to play in the background, but an app will still be able to play regardless of the setting of the ringer switch (3) Other categories this defaults to false and cannot be changed (that is, the mix with others setting of these categories cannot be overridden. An application must be prepared for setting this property to fail as behaviour may change in future releases. If an application changes their category, they should reassert the option (it is not sticky across category changes). `MixWithOthers` is only valid with `AVAudioSessionCategoryPlayAndRecord`, `AVAudioSessionCategoryPlayback`, and `AVAudioSessionCategoryMultiRoute`

DuckOthers This allows an application to set whether or not other active audio apps will be ducked when your app's audio session goes active. An example of this is the Nike app, which provides periodic

updates to its user (it reduces the volume of any music currently being played while it provides its status). This defaults to off. Note that the other audio will be ducked for as long as the current session is active. You will need to deactivate your audio session when you want full volume playback of the other audio. If your category is `AVAudioSessionCategoryPlayback`, `AVAudioSessionCategoryPlayAndRecord`, or `AVAudioSessionCategoryMultiRoute`, by default the audio session will be non-mixable and non-ducking. Setting this option will also make your category mixable with others (`AVAudioSessionCategoryOptionMixWithOthers` will be set). `DuckOthers` is only valid with `AVAudioSessionCategoryAmbient`, `AVAudioSessionCategoryPlayAndRecord`, `AVAudioSessionCategoryPlayback`, and `AVAudioSessionCategoryMultiRoute`.

AllowBluetooth This allows an application to change the default behaviour of some audio session categories with regards to showing bluetooth Hands-Free Profile (HFP) devices as available routes. The current category behavior is: (1) `AVAudioSessionCategoryPlayAndRecord` this will default to false, but can be set to true. This will allow a paired bluetooth HFP device to show up as an available route for input, while playing through the category-appropriate output (2) `AVAudioSessionCategoryRecord` this will default to false, but can be set to true. This will allow a paired bluetooth HFP device to show up as an available route for input (3) Other categories this defaults to false and cannot be changed (that is, enabling bluetooth for input in these categories is not allowed) An application must be prepared for setting this option to fail as behaviour may change in future releases. If an application changes their category or mode, they should reassert the override (it is not sticky across category and mode changes). `AllowBluetooth` is only valid with `AVAudioSessionCategoryRecord` and `AVAudioSessionCategoryPlayAndRecord`.

DefaultToSpeaker This allows an application to change the default behaviour of some audio session categories with regards to the audio route. The current category behavior is: (1) `AVAudioSessionCategoryPlayAndRecord` category this will default to false, but can be set to true. this will route to Speaker (instead of Receiver) when no other audio route is connected. (2) Other categories this defaults to false and cannot be changed (that is, the default to speaker setting of these categories cannot be overridden) An application must be prepared for setting this property to fail as behaviour may change in future releases. If an application changes their category, they should reassert the override (it is not sticky across category and mode changes). `DefaultToSpeaker` is only valid with `AVAudioSessionCategoryPlayAndRecord`.

2.3.1.3 enum AudioSessionMode [strong]

Enumerator

Default Modes modify the audio category in order to introduce behavior that is tailored to the specific use of audio within an application. Available in iOS 5.0 and greater. The default mode `API_AVAILABLE(ios(5.0), watchos(2.0), tvos(9.0))` `API_UNAVAILABLE(macos)`;

VoiceChat Only valid with `AVAudioSessionCategoryPlayAndRecord`. Appropriate for Voice over IP (VoIP) applications. Reduces the number of allowable audio routes to be only those that are appropriate for VoIP applications and may engage appropriate system-supplied signal processing. Has the side effect of setting `AVAudioSessionCategoryOptionAllowBluetooth` `API_AVAILABLE(ios(5.0), watchos(2.0), tvos(9.0))` `API_UNAVAILABLE(macos)`;

VideoRecording Only valid with `AVAudioSessionCategoryPlayAndRecord` or `AVAudioSessionCategoryRecord`. Modifies the audio routing options and may engage appropriate system-supplied signal processing. `API_AVAILABLE(ios(5.0), watchos(2.0), tvos(9.0))` `API_UNAVAILABLE(macos)`;

Measurement Appropriate for applications that wish to minimize the effect of system-supplied signal processing for input and/or output audio signals. `API_AVAILABLE(ios(5.0), watchos(2.0), tvos(9.0))` `API_UNAVAILABLE(macos)`;

MoviePlayback Engages appropriate output signal processing for movie playback scenarios. Currently only applied during playback over built-in speaker. `API_AVAILABLE(ios(6.0), watchos(2.0), tvos(9.0))` `API_UNAVAILABLE(macos)`;

VideoChat Only valid with `kAudioSessionCategory_PlayAndRecord`. Reduces the number of allowable audio routes to be only those that are appropriate for video chat applications. May engage appropriate system-supplied signal processing. Has the side effect of setting `AVAudioSessionCategoryOptionAllowBluetooth` and `AVAudioSessionCategoryOptionDefaultToSpeaker`. `API_AVAILABLE(ios(7.0), watchos(2.0), tvos(9.0))` `API_UNAVAILABLE(macos)`;

Voip Gives best quality at a given bitrate for voice signals. It enhances the input signal by high-pass filtering and emphasizing formants and harmonics. Optionally it includes in-band forward error correction to protect against packet loss. Use this mode for typical VoIP applications. Because of the enhancement, even at high bitrates the output may sound different from the input.

Audio Gives best quality at a given bitrate for most non-voice signals like music. Use this mode for music and mixed (music/voice) content, broadcast, and applications requiring less than 15 ms of coding delay.

RestrictedLowDelay Configures low-delay mode that disables the speech-optimized mode in exchange for slightly reduced delay.

2.8.1.5 enum SignalHint : int [strong]

Enumerator

Auto (default)

Voice Bias thresholds towards choosing LPC or Hybrid modes

Music Bias thresholds towards choosing MDCT modes.

3.8.2 Member Function Documentation

3.8.2.1 static void Convert (float[] *src*, short[] *dst*, int *dstCount*) [static]

Convert audio buffer from float to short samples.

Parameters

<i>src</i>	Source buffer.
<i>dst</i>	Destination buffer.
<i>dstCount</i>	Size of destination buffer (in total samples), source buffer must be of same length or longer.

3.8.2.2 static void Convert (short[] *src*, float[] *dst*, int *dstCount*) [static]

Convert audio buffer from short to float samples.

Parameters

<i>src</i>	Source buffer.
<i>dst</i>	Destination buffer.
<i>dstCount</i>	Size of destination buffer (in total samples), source buffer must be of same length or longer.

3.8.2.3 static void ForceToStereo< T > (T[] *src*, T[] *dst*, int *srcChannels*) [static]

Convert audio buffer with arbitrary number of channels to stereo.

For mono sources (*srcChannels*==1), the signal will be copied to both Left and Right stereo channels. For all others, the first two available channels will be used, any other channels will be discarded.

Parameters

<i>src</i>	Source buffer.
<i>dst</i>	Destination buffer.
<i>srcChannels</i>	Number of (interleaved) channels in <i>src</i> .

3.8.2.4 static void Resample< T > (T[] *src*, T[] *dst*, int *dstCount*, int *channels*) [static]

Resample audio data so that the complete *src* buffer fits into *dstCount* samples in the *dst* buffer.

This implements a primitive nearest-neighbor resampling algorithm for an arbitrary number of channels.

Parameters

<i>src</i>	Source buffer.
